
Letter from the Editor

The Journal's Quality Controllers

The *Journal of Nuclear Medicine Technology* has had the good fortune to be supported by many talented people during 1981.

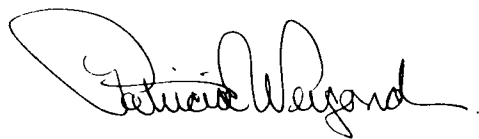

One group, the manuscript reviewers, is responsible for much of the scientific refinement that takes place during an article's metamorphosis. The manuscript reviewers examine the content to make certain that all parts of an article are understandable, that the methods used are appropriate, that the results are clearly stated, and that the conclusions are logically supported.

In addition, and perhaps most importantly, they counsel me on whether they feel an article should be published by this Journal. In effect, they are instrumental in deciding what you read. This function is taken very seriously by all concerned because of its impact.

As has been my annual custom, I would like to applaud these individuals and thank them for their continued excellent support.
