the capabilities of the military in this context are not discussed here.

CONCLUSION

The complex nature of today's disasters, particularly regarding weapons of mass destruction, have increased the need for a multidisciplinary medical response. Nuclear and radiological disasters have enormous medical and public health consequences. Medical responders in Pakistan are not appropriately trained for such events and are therefore not confident about handling disasters of such a high magnitude, despite a high level of motivation and dedication. The Pakistan military, being the most disciplined organization in the country, responds first in all kinds of disasters. But the major responsibility should be borne by the different response agencies, which seem to be more inclined toward handling recurring disasters. The level of knowledge and the handling capability of these agencies against nuclear disaster should be enhanced to enable an effective response. For this purpose, as a start, the medical first responders may be encouraged and incentivized to complete World Health Organization online courses. Moreover, national health authorities may seek policy advice and technical support from the World Health Organization on preparedness, response, recovery, and long-term follow-up of populations.

Erratum

There were two errors in the article "Breast Cancer: Evaluating Tumor Estrogen Receptor Status with Molecular Imaging to Increase Response to Therapy and Patient Outcomes," by Grabher (*J Nucl Med Technol.* 2020;48:191–201). The article incorrectly stated that ¹⁸F-fluoroestradiol was not an FDA-approved product. In fact, the product was approved before publication of the article, which was not corrected to reflect that change. There was also an error in the description of a Nottingham grade 3 tumor. A grade 3 tumor is considered poorly differentiated, as correctly stated in Table 3, not well-differentiated, as incorrectly stated in the text. The author regrets the errors.
